## **Cheat Sheet: API's and Data Collection**

```
Package/Method Description
                                                                                                       Code Example
                               Syntax:
                                  1. attribute = element[(attribute)]
                 Access the
                 value of a
                               Copied!
                 specific
Accessing
                attribute of an Example:
element attribute
                 HTML
                 element.
                                  1. 1
                                  1. href = link_element[(href)]
                                Copied!
                               Syntax:
                                  1. 1
                 Parse the
                 HTML content
                                  1. soup = BeautifulSoup(html, (html.parser))
                of a web page
                                Copied!
                 using
                 BeautifulSoup.
BeautifulSoup()
                               Example:
                 The parser
                 type can vary
                 based on the
                 project.
                                  1. html = (https://api.example.com/data) soup = BeautifulSoup(html, (html.parser))
                               Copied!
                               Syntax:
                 Send a
                 DELETE
                 request to
                                  1. response = requests.delete(url)
                 remove data or
                 a resource
                               Copied!
                 from the
delete()
                 server.
                               Example:
                 DELETE
                 requests delete
                                  1. 1
                 a specified
                                  1. response = requests.delete((https://api.example.com/delete))
                 resource on
                 the server.
                               Copied!
                               Syntax:
                                  1. 1
                                  1. element = soup.find(tag, attrs)
                 Find the first
                 HTML
                               Copied!
                 element that
find()
                 matches the
                               Example:
                 specified tag
                 and attributes.
                                  1. first_link = soup.find((a), {(class): (link)})
                                Copied!
                               Syntax:
                                  1. 1
                                  1. elements = soup.find_all(tag, attrs)
                 Find all
                 HTML
                               Copied!
                 elements that
find_all()
                 match the
                               Example:
                 specified tag
                 and attributes.
                                  1. all_links = soup.find_all((a), {(class): (link)})
                                Copied!
                               Syntax:
                                  1. children = element.findChildren()
                 Find all child
                                Copied!
                 elements of an
findChildren()
                 HTML
                               Example:
                 element.
                                  1. 1
                                  1. child_elements = parent_div.findChildren()
                               Copied!
                 Perform a
get()
                               Syntax:
                 GET request
```

about:blank 1/4

```
to retrieve data
                                  1. 1
                 from a
                                  1. response = requests.get(url)
                 specified
                 ÛRL. GET
                                Copied!
                 requests are
                 typically used Example:
                 for reading
                 data from an
                 API. The
                                   1. response = requests.get((https://api.example.com/data))
                 response
                 variable will
                                Copied!
                 contain the
                 server's
                 response,
                 which you can
                 process
                 further.
                 Include
                                Syntax:
                 custom
                 headers in the
                 request.
                                  1. headers = {(HeaderName): (Value)}
                 Headers can
                                Copied!
                 provide
Headers
                 additional
                 information to Example:
                 the server.
                 such as
                 authentication
                                  1. base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = requests.ge
                 tokens or
                                Copied!
                 content types.
                                Syntax:
                 Import the
                 necessary
                                  1. 1
Import Libraries
                 Python
                                  1. from bs4 import BeautifulSoup
                 libraries for
                 web scraping.
                                Copied!
                 Parse JSON
                 data from the
                 response. This Syntax:
                 extracts and
                 works with the
                                   1. data = response.json()
                 data returned
                 by the API.
                                Copied!
                 The
                 response.json() Example:
json()
                 method
                 converts the
                                  1. 1
                 JSON
                 response into a
                                   1. response = requests.get((https://api.example.com/data))
                 Python data
                                   2. data = response.json()
                 structure
                 (usually a
                                 Copied!
                 dictionary or
                 list).
                                Syntax:
                                   1. sibling = element.find_next_sibling()
                 Find the next
                                Copied!
                 sibling
next_sibling()
                 element in the Example:
                 DOM.
                                  1. next_sibling = current_element.find_next_sibling()
                                Copied!
                                Syntax:
                                  1. 1
                                  1. parent = element.parent
                 Access the
                 parent element Copied!
                 in the
parent
                 Document
                                Example:
                 Object Model
                 (DOM).
                                  1. parent_div = paragraph.parent
                                Copied!
                 Send a POST Syntax:
post()
                 request to a
                 specified URL
                 with data.
                                  1. response = requests.post(url, data)
                 Create or
```

about:blank 2/4

```
update POST
                                    Copied!
                   requests using
                   resources on
                                   Example:
                   the server. The
                   data parameter
                   contains the
                                       1. response = requests.post((https://api.example.com/submit), data={(key): (value)})
                   data to send to
                   the server,
                                     Copied!
                   often in JSON
                   format.
                   Send a PUT
                   request to
                                   Syntax:
                   update data on
                   the server.
                                       1. 1
                   PUT requests

    response = requests.put(url, data)

                   are used to
                   update an
                                    Copied!
                   existing
put()
                   resource on
                                    Example:
                   the server with
                   the data
                   provided in the
                                       1. response = requests.put((https://api.example.com/update), data={(key): (value)})
                   data
                   parameter,
                                    Copied!
                   typically in
                   JSON format.
                                    Syntax:
                                       1. 1
                   Pass query
                                       1. params = {(param_name): (value)}
                   parameters in
                   the URL to
                                     Copied!
                   filter or
                   customize the Example:
Query parameters request. Query
                   parameters
                                       1. 1
                                       2. 2
                   specify
                                       3. 3
                   conditions or
                   limits for the
                                       1. base_url = "https://api.example.com/data"
2. params = {"page": 1, "per_page": 10}
3. response = requests.get(base_url, params=params)
                   requested data.
                                    Copied!
                                    Syntax:
                                       1. 1
                                       1. element = soup.select(selector)
                   Select HTML
                   elements from Copied!
select()
                   the parsed
                   HTML using a Example:
                   CSS selector.
                                       1. 1
                                       1. titles = soup.select((h1))
                                    Copied!
                   Check the
                                    Syntax:
                   HTTP status
                   code of the
                                       1. 1
                   response. The

    response.status_code

                   HTTP status
                   code indicates
                                   Copied!
                   the result of
                   the request
                                    Example:
status_code
                   (success, error,
                   redirection).
                   Use the HTTP
                                       3. 3
                   status codeIt
                   can be used for
                                       1. url = "https://api.example.com/data"
                   error handling
